Errata

Logical Operators

- OR is XOR: use **xor** keyword
- Do we also need **or**?
- Do we need **priority and**?

Deal with multiplicity of bindings and arrays

- **All** operator
- “all but k”: (equivalent to **orless** noerror): **all** (<set>) - k

Improve logic description

- Multiple transitions from same source to same target

No syntax changes. Stay with or. No change in path to error type in applies to.

Allow **all** operator (does not break existing models).
